

Executing the American Heart Association's (AHA) strategic mission of "being a relentless force for a world of longer, healthier lives" requires reliable surveillance data to measure progress. The American Heart Association (AHA) is a leading national public health organization that has been instrumental in the development of the National Public Health Statistics System (NPHSS) and the National Health and Medical Research Council (NHMRC) surveillance system. The NPHSS is a comprehensive system of surveillance data that includes cardiovascular and other noncommunicable diseases and their determinants. The NHMRC surveillance system is a comprehensive system of surveillance data that includes cardiovascular and other noncommunicable diseases and their determinants. The NPHSS and NHMRC surveillance systems are essential for the development of effective local and national public health programs.

Such a transformation could be strongly supportive of the surveillance requirements of CV included cardiovascular and other noncommunicable diseases and their determinants. Ac events and chronic disease management is fragmented and incomplete. These gaps have and effective local and national

Modernizing the public health surveillance
